                                                                                                                                                                                                                                                                                                                                                                                                                                       CC with the interleukin-6 receptor (II-6R) via assessing and obtaining the CC stereochemical complementarity between the compound and a topographic cregion of the receptor and testing the compound for its ability to CC modulate an activity associated with the receptor. Also disclosed is the CC crystal structure of the II-6R alpha chain. The compounds of the CC invention and treatment of diseases associated with signalling by II-6R prostate cancer, Castleman's diseases, AIDS, mesangial proliferative CC prostate cancer, Castleman's disease, AIDS, mesangial proliferative CC prostate cancer, Castleman's disease, AIDS, mesangial proliferative CC prostate cancer, Castleman's disease, AIDS, mesangial proliferative to the naturally occurring II-6 receptor ligand as well as a rational basis CC for the development of ligands for specific therapeutic applications. The information provided by the II-6R crystal structure will facilitate a CC substitution. Note: The current sequence is not shown within the CC substitution but was created by the invention which contains a C192A CC substitution but was created by the invention which contains a C192A contains a C192A contains and contains a C192A contains a created by the invention which contains a C192A contains a created by the indexer using the human II-6R alpha

                                                                                                                                                                                                                                                                                                               The invention relates to the production of human interleukin-6 receptor (IL-6R) protein in the fungus Pichia pastoris. The fungus was transformed with an expression vector (pOIC9-A20LL) containing a gene encoding an IL-6R protein having an immunoglobulin-like region and cytokine receptor region and spanning amino acids from Leu20-Ala323. The human IL-6R region was PCR amplified using the primers AAA70702-A70703. This sequence represents the recombinant IL-6R protein of the invention

                                                                                                                                                                                                                                                                                                              The invention relates to a method for the preparation of bovine interleukin 12 (BoILI2). BoILI2 consists of a heterodimer of p35 and p40 subunits. BoILI2 is produced by introducing into a host cell, recombinant vectors containing genes encoding the p35 and p40 subunits. This sequence represents the bovine ILI2 p35 subunit. Interleukin 12 is used for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sepsis;
                                                                                                                                                                                                                                     interact
                                                                                                                                                                                                                                                                                                                                                                     interact
                                                                                                                                                                                                                                                                                                                                                                                                     interact
                                                                   interact
                                                                                                   interact
   The invention relates to selecting or designing a compound that interacts with the interleukin-6 receptor (IL-6R) via assessing and obtaining the stereochemical complementarity between the compound and a topographic region of the receptor and testing the compound for its ability to modulate an activity associated with the receptor. Also disclosed is the crystal structure of the IL-6R alpha chain. The compounds of the invention act as cytokine receptor modulators and may be useful in the prevention and treatment of diseases associated with signalling by IL-6R such as multiple myeloma, lymphoma, inflammation, rheumatoid arthritis, prostate cancer, Castleman's disease, AIDS, mesangial proliferative glomerulonephritis, Kaposi's sarcoma, sepsis, osteoporosis and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Misc-difference
                                                                                                                                                        Selecting or designing compound interacting with interleukin receptor, useful for treatment of e.g. AIDS, involves assessing and testing compound to modulate activity of receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The method provides enhanced stereochemical complementarity relative to the naturally occurring IL-6 receptor ligand as well as a rational basis for the development of ligands for specific therapeutic applications. The information provided by the IL-6R crystal structure will facilitate a more accurate understanding of how the binding of a ligand leads to signal transduction. The current sequence is that of the human IL-6R alpha chain mutant protein of the invention which contains a W214N substitution. Note: The present sequence is not shown within the specification but was created by the indexer using the human IL-6R alpha chain wild-type protein sequence (AAO23014)

interleukin-6 receptor precursor - rat

N;Alternate names: IL-6 receptor

C;Species: Rattus norvegicus (Norway rat)

C;Date: 30-Jun-1993 #sequence_revision 30-Jun-1993 #text_change 09-Jul-2004

C;Accession: A37986

R;Baumann, M.; Baumann, H.; Fey, G.H.

J. Biol. Chem. 265, 19853-19862, 1990

A;Title: Molecular cloning, characterization and functional expression of the rat liver

A;Reference number: A37986; MUID:91060602; PMID:2174054

A;Recession: A37986

A;Molecule type: mRNA

A;Cross-references: UNIPROT:P22273; GB:M58587; GB:J05668; NID:g204921; PIDN:AAA41431.1;

C;Comment: The CNTF receptor is attached to the membrane by a glycosylphosphatidylinosit
C;Comment: The CNTF receptor sequence appears to contain several PEST regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A;Cross-references: UNIPROT:P26992; GB:M73238
